Much can be done to prevent and treat stroke and the number of people who will die from stroke will increase to 6.7 million each year.

**STROKE: A Preventable and Treatable Condition**

Cholesterol, obesity, diabetes, stroke, heart disease—these are all related to one another and can be managed with lifestyle changes. Early treatment can help reduce the risk of stroke.

**Time is Brain**

What are the treatment options for patients presenting with stroke? The concept of "time is brain" is crucial in stroke management. The sooner treatment is initiated, the better the outcome.

**Antiplatelet Agents in Secondary Prevention**

Aspirin & Dipyridamole, clopidogrel, and other agents have been studied for their efficacy in preventing stroke. The relative risk reduction for stroke with aspirin and dipyridamole compared to placebo was about 24%.

**Role of Family in Stroke**

The role of family in stroke care cannot be overstated. Family members can provide crucial support and care to stroke patients, helping them recover and manage their condition.

**Conclusion**

Stroke is a condition with unique epidemiological features. It is preventable, and significant efforts are being made to educate the public about its causes and risk factors. The scientific community is working on developing better treatments and interventions to improve outcomes.
